Wiener Index in Graphs

• Let G = (V, E) be a wieghted undirected graph.

Karim Abu-Affash (SCE)

WADS 2023

Wiener Index in Graphs

- Let G = (V, E) be a wieghted undirected graph.
- Let $\delta_G(u, v)$ denote the shortest (minimum-wieght) path between the vertices u and v in G.

Karim Abu-Affash (SCE)

Wiener Index in Graphs

- Let G = (V, E) be a wieghted undirected graph.
- Let δ_G(u, v) denote the shortest (minimum-wieght) path between the vertices u and v in G.
- The Wiener index of *G*, *W*(*G*), is defined as the sum of the shortest paths between every pair of vertices in *G*, i.e.,

$$W(G) = \sum_{u,v\in V} \delta_G(u,v)$$

• The Wiener index was first introduced by the chemist Haryy Wiener in 1947 to correlate between the boiling point (and later other chemical properties) and the molecule structure.

- The Wiener index was first introduced by the chemist Haryy Wiener in 1947 to correlate between the boiling point (and later other chemical properties) and the molecule structure.
- Molecules structure can be modeled as an undirected graph: each vertex represents an atom and each edge represents a bond between two atoms.

- The Wiener index was first introduced by the chemist Haryy Wiener in 1947 to correlate between the boiling point (and later other chemical properties) and the molecule structure.
- Molecules structure can be modeled as an undirected graph: each vertex represents an atom and each edge represents a bond between two atoms.
- The Wiener index of molecular graphs can be used to predict properties of the corresponding molecules.

- The Wiener index was first introduced by the chemist Haryy Wiener in 1947 to correlate between the boiling point (and later other chemical properties) and the molecule structure.
- Molecules structure can be modeled as an undirected graph: each vertex represents an atom and each edge represents a bond between two atoms.
- The Wiener index of molecular graphs can be used to predict properties of the corresponding molecules.

Most of works related to Wiener index focus on computing and bounding the Wiener index of specific graphs or classes of graphs.

In Network Design: Given an undirected graph G = (V, E) and a (non-negative) weight function (representing the delay on each edge), the **routing cost** c(T) of a spanning tree T of G is

$$c(T) = \sum_{u,v \in V} \delta_T(u,v)$$

In Network Design: Given an undirected graph G = (V, E) and a (non-negative) weight function (representing the delay on each edge), the **routing cost** c(T) of a spanning tree T of G is

$$c(T) = \sum_{u,v \in V} \delta_T(u,v)$$

The Minimum Routing Cost Spanning Tree (MRCST) problem

Given a weighted undirected graph G = (V, E), compute a minimum routing cost spanning tree of G.

In Network Design: Given an undirected graph G = (V, E) and a (non-negative) weight function (representing the delay on each edge), the **routing cost** c(T) of a spanning tree T of G is

$$c(T) = \sum_{u,v \in V} \delta_T(u,v)$$

The Minimum Routing Cost Spanning Tree (**MRCST**) problem

Given a weighted undirected graph G = (V, E), compute a minimum routing cost spanning tree of G.

• **MRCST** is NP-complete, even if all edge weights are 1 [Johnson et al. 1978].

In Network Design: Given an undirected graph G = (V, E) and a (non-negative) weight function (representing the delay on each edge), the **routing cost** c(T) of a spanning tree T of G is

$$c(T) = \sum_{u,v \in V} \delta_T(u,v)$$

The Minimum Routing Cost Spanning Tree (MRCST) problem

Given a weighted undirected graph G = (V, E), compute a minimum routing cost spanning tree of G.

- **MRCST** is NP-complete, even if all edge weights are 1 [Johnson et al. 1978].
- There exists a PTAS for MRCST [Wu et al. 2000].

(3)

4 A N

Optimal Tree is Planar

Let P be a set of n points in the plane and let T be a tree that minimizes the Wiener index.

Lemma 1

T is planar.

11/38

< ロ > < 同 > < 回 > < 回 >

Optimal Tree is Planar

Let P be a set of n points in the plane and let T be a tree that minimizes the Wiener index.

Proof:

Assume towards a contradiction that there are two crossing edges
 (a, c) and (b, d) in T.

Optimal Tree is Planar

Let P be a set of n points in the plane and let T be a tree that minimizes the Wiener index.

Proof:

Assume towards a contradiction that there are two crossing edges (a, c) and (b, d) in T.

Let T_{ab}, T_c, and T_d be the sub-trees obtained by removing the edges (a, c) and (b, d) from T.

- Let T_{ab} , T_c , and T_d be the sub-trees obtained by removing the edges (a, c) and (b, d) from T.
- Let n_{ab} , n_c , and n_d be the number of points in T_{ab} , T_c , and T_d , respectively.

- Let T_{ab}, T_c, and T_d be the sub-trees obtained by removing the edges (a, c) and (b, d) from T.
- Let n_{ab} , n_c , and n_d be the number of points in T_{ab} , T_c , and T_d , respectively.
- Let $\delta_a(T_{ab}) = \sum_{p \in T_{ab}} \delta_T(a, p)$ denote the total weight of the paths from *a* to every point in T_{ab}

- Let T_{ab}, T_c, and T_d be the sub-trees obtained by removing the edges (a, c) and (b, d) from T.
- Let n_{ab} , n_c , and n_d be the number of points in T_{ab} , T_c , and T_d , respectively.
- Let $\delta_a(T_{ab}) = \sum_{p \in T_{ab}} \delta_T(a, p)$ denote the total weight of the paths from *a* to every point in T_{ab} (Similarly, $\delta_b(T_{ab})$, $\delta_c(T_c)$, $\delta_d(T_d)$).

Thus,

$$W(T) = W(T_{ab}) + n_c \cdot \delta_a(T_{ab}) + n_d \cdot \delta_b(T_{ab})$$

Karim Abu-Affash (SCE)

Geometric Wiener Index

WADS 2023

Thus,

$$W(T) = W(T_{ab}) + n_c \cdot \delta_a(T_{ab}) + n_d \cdot \delta_b(T_{ab}) + W(T_c) + (n_{ab} + n_d) \cdot \delta_c(T_c)$$

Karim Abu-Affash (SCE)

WADS 2023

Thus,

$$W(T) = W(T_{ab}) + n_c \cdot \delta_a(T_{ab}) + n_d \cdot \delta_b(T_{ab}) + W(T_c) + (n_{ab} + n_d) \cdot \delta_c(T_c) + W(T_d) + (n_{ab} + n_c) \cdot \delta_d(T_d)$$

Thus,

$$W(T) = W(T_{ab}) + n_c \cdot \delta_a(T_{ab}) + n_d \cdot \delta_b(T_{ab}) + W(T_c) + (n_{ab} + n_d) \cdot \delta_c(T_c) + W(T_d) + (n_{ab} + n_c) \cdot \delta_d(T_d) + n_c(n_{ab} + n_d) \cdot |ac|$$

Thus,

$$W(T) = W(T_{ab}) + n_c \cdot \delta_a(T_{ab}) + n_d \cdot \delta_b(T_{ab}) + W(T_c) + (n_{ab} + n_d) \cdot \delta_c(T_c) + W(T_d) + (n_{ab} + n_c) \cdot \delta_d(T_d) + n_c(n_{ab} + n_d) \cdot |ac| + n_d(n_{ab} + n_c) \cdot |bd|$$

Karim Abu-Affash (SCE)

WADS 2023

13/38

æ

Thus,

$$W(T) = W(T_{ab}) + n_c \cdot \delta_a(T_{ab}) + n_d \cdot \delta_b(T_{ab}) + W(T_c) + (n_{ab} + n_d) \cdot \delta_c(T_c) + W(T_d) + (n_{ab} + n_c) \cdot \delta_d(T_d) + n_c(n_{ab} + n_d) \cdot |ac| + n_d(n_{ab} + n_c) \cdot |bd| + n_c \cdot n_d \cdot \delta_T(a, b)$$

æ
Let T' be the spanning tree of P obtained from T by replacing the edge (b, d) by the edge (a, d).

- Let T' be the spanning tree of P obtained from T by replacing the edge (b, d) by the edge (a, d).
- Let T" be the spanning tree of P obtained from T by replacing the edge (a, c) by the edge (b, c).

Thus,

$$W(T') = W(T_{ab}) + (n_c + n_d) \cdot \delta_a(T_{ab}) + W(T_c) + (n_{ab} + n_d) \cdot \delta_c(T_c) + n_c(n_{ab} + n_d) \cdot |ac| + W(T_d) + (n_{ab} + n_c) \cdot \delta_d(T_d) + n_d(n_{ab} + n_c) \cdot |ad|$$

T'

Karim Abu-Affash (SCE)

Geometric Wiener Index

WADS 2023

イロト イポト イヨト イヨト

15/38

æ

and

$$W(T'') = W(T_{ab}) + (n_c + n_d) \cdot \delta_b(T_{ab}) + W(T_c) + (n_{ab} + n_d) \cdot \delta_c(T_c) + n_c(n_{ab} + n_d) \cdot |bc| + W(T_d) + (n_{ab} + n_c) \cdot \delta_d(T_d) + n_d(n_{ab} + n_c) \cdot |bd|$$

Karim Abu-Affash (SCE)

Geometric Wiener Index

Therefore,

$$W(T) - W(T') = n_d (\delta_b(T_{ab}) - \delta_a(T_{ab})) + n_d (n_{ab} + n_c) (|bd| - |ad|) + n_c \cdot n_d \cdot \delta_T(a, b)$$

Karim Abu-Affash (SCE)

æ

and

$$W(T) - W(T'') = n_c (\delta_a(T_{ab}) - \delta_b(T_{ab})) + n_c (n_{ab} + n_d) (|ac| - |bc|) + n_c \cdot n_d \cdot \delta_T(a, b)$$

If W(T) - W(T') > 0 or W(T) - W(T'') > 0, then this contradicts the minimality of T, and we are done.

- If W(T) W(T') > 0 or W(T) W(T'') > 0, then this contradicts the minimality of T, and we are done.
- Otherwise,

$$W(T) - W(T') = n_d (\delta_b(T_{ab}) - \delta_a(T_{ab})) + n_d(n_{ab} + n_c) (|bd| - |ad|) + n_c \cdot n_d \cdot \delta_T(a, b) \le 0$$

and

$$W(T) - W(T'') = n_c (\delta_a(T_{ab}) - \delta_b(T_{ab})) + n_c (n_{ab} + n_d) (|ac| - |bc|) + n_c \cdot n_d \cdot \delta_T(a, b) \le 0$$

19/38

- If W(T) W(T') > 0 or W(T) W(T'') > 0, then this contradicts the minimality of T, and we are done.
- Otherwise,

$$W(T) - W(T') = n_d (\delta_b(T_{ab}) - \delta_a(T_{ab})) + n_d(n_{ab} + n_c) (|bd| - |ad|) + n_c \cdot n_d \cdot \delta_T(a, b) \le 0$$

and

$$W(T) - W(T'') = n_c (\delta_a(T_{ab}) - \delta_b(T_{ab})) + n_c (n_{ab} + n_d) (|ac| - |bc|) + n_c \cdot n_d \cdot \delta_T(a, b) \le 0$$

• Since
$$n_c > 0$$
 and $n_d > 0$, we have
 $\delta_b(T_{ab}) - \delta_a(T_{ab}) + (n_{ab} + n_c)(|bd| - |ad|) + n_c \cdot \delta_T(a, b) \le 0$
 $\delta_a(T_{ab}) - \delta_b(T_{ab}) + (n_{ab} + n_d)(|ac| - |bc|) + n_d \cdot \delta_T(a, b) \le 0$

• By summing the two inequalities,

$$\begin{split} \delta_b(T_{ab}) &- \delta_a(T_{ab}) + (n_{ab} + n_c) (|bd| - |ad|) + n_c \cdot \delta_T(a, b) \leq 0\\ \delta_a(T_{ab}) &- \delta_b(T_{ab}) + (n_{ab} + n_d) (|ac| - |bc|) + n_d \cdot \delta_T(a, b) \leq 0\\ \text{we have} \end{split}$$

 $(n_{ab}+n_c)\big(|bd|-|ad|\big)+(n_{ab}+n_d)\big(|ac|-|bc|\big)+(n_c+n_d)\cdot\delta_{T}(a,b)\leq 0$

э

크 에 프 어 프 어 프

By summing the two inequalities,

 $\delta_b(T_{ab}) - \delta_a(T_{ab}) + (n_{ab} + n_c)(|bd| - |ad|) + n_c \cdot \delta_T(a, b) \le 0$ $\delta_a(T_{ab}) - \delta_b(T_{ab}) + (n_{ab} + n_d)(|ac| - |bc|) + n_d \cdot \delta_T(a, b) \le 0$ we have

 $(n_{ab}+n_c)(|bd|-|ad|)+(n_{ab}+n_d)(|ac|-|bc|)+(n_c+n_d)\cdot\delta_T(a,b) \le 0$

That is.

$$n_{ab}(|bd| + |ac| - |ad| - |bc|) + n_c(|bd| + \delta_T(a, b) - |ad|) + n_d(|ac| + \delta_T(a, b) - |bc|) \le 0$$

э

• By summing the two inequalities,

$$\begin{split} \delta_b(T_{ab}) &- \delta_a(T_{ab}) + (n_{ab} + n_c) (|bd| - |ad|) + n_c \cdot \delta_T(a, b) \leq 0 \\ \delta_a(T_{ab}) &- \delta_b(T_{ab}) + (n_{ab} + n_d) (|ac| - |bc|) + n_d \cdot \delta_T(a, b) \leq 0 \\ \text{we have} \end{split}$$

 $(n_{ab}+n_c)\big(|bd|-|ad|\big)+(n_{ab}+n_d)\big(|ac|-|bc|\big)+(n_c+n_d)\cdot\delta_{\mathcal{T}}(a,b)\leq 0$

That is,

$$\begin{split} n_{ab}\big(|bd| + |ac| - |ad| - |bc|\big) + n_c\big(|bd| + \delta_T(a, b) - |ad|\big) \\ + n_d\big(|ac| + \delta_T(a, b) - |bc|\big) \leq 0 \end{split}$$

• Since n_{ab} , n_c , $n_d > 0$, and, by the triangle inequality, |bd| + |ac| - |ad| - |bc| > 0, $|bd| + \delta_T(a, b) - |ad| > 0$, and $|ac| + \delta_T(a, b) - |bc| > 0$, this is a contradiction.

- Let $T_{i,j}$ be a spanning tree of P[i, j], and let $W(T_{i,j})$ denote its Wiener index.

Karim Abu-Affash (SCE)

Let $P = \{p_1, p_2, \dots, p_n\}$ be a set of *n* points in convex position:

- For each $1 \le i \le j \le n$, let $P[i, j] \subseteq P$ be the set $\{p_i, p_{i+1}, \dots, p_j\}$.
- Let $T_{i,j}$ be a spanning tree of P[i,j], and let $W(T_{i,j})$ denote its Wiener index.
- Let $\delta_i(T_{i,j})$ be the total weight of the paths from p_i to every point of P[i, j] in $T_{i,j}$ (Similarly, $\delta_j(T_{i,j})$).

 Let T be a (planar) minimum Wiener index spanning tree of P and let W* = W(T).

Karim Abu-Affash (SCE)

WADS 2023

23/38

- Let T be a (planar) minimum Wiener index spanning tree of P and let W* = W(T).
- Let p_j be the point with maximum *j* that is connected to p_1 in *T*.

Karim Abu-Affash (SCE)

- Let *T* be a (planar) minimum Wiener index spanning tree of *P* and let $W^* = W(T)$.
- Let p_j be the point with maximum *j* that is connected to p_1 in *T*.
- Moreover, there exists an index $1 \le i < j$ such that all the points in P[1, i] are closer to p_1 than to p_j in T, and all the points in P[i+1, j] are closer to p_j than to p_1 in T.

Karim Abu-Affash (SCE)

Hence,

$$W^* = W(T_{1,i}) + (n-i) \cdot \delta_1(T_{1,i})$$

Karim Abu-Affash (SCE)

WADS 2023

24/38

Hence,

$$W^* = W(T_{1,i}) + (n-i) \cdot \delta_1(T_{1,i}) + W(T_{i+1,j}) + (n-j+i) \cdot \delta_j(T_{i+1,j})$$

Karim Abu-Affash (SCE)

WADS 2023

24/38

Hence,

$$W^* = W(T_{1,i}) + (n-i) \cdot \delta_1(T_{1,i}) + W(T_{i+1,j}) + (n-j+i) \cdot \delta_j(T_{i+1,j}) + W(T_{j,n}) + (j-1) \cdot \delta_j(T_{j,n})$$

Karim Abu-Affash (SCE)

WADS 2023

24/38

Hence,

$$W^* = W(T_{1,i}) + (n-i) \cdot \delta_1(T_{1,i}) + W(T_{i+1,j}) + (n-j+i) \cdot \delta_j(T_{i+1,j}) + W(T_{j,n}) + (j-1) \cdot \delta_j(T_{j,n}) + i(n-i) \cdot |p_1p_j|$$

Karim Abu-Affash (SCE)

WADS 2023

• Let $W_j[i, j] = W(T_{i,j}) + (n - j + i - 1) \cdot \delta_j(T_{i,j})$ be the minimum value obtained by a spanning tree $T_{i,j}$ of P[i, j] rooted at p_j .

- Let $W_j[i, j] = W(T_{i,j}) + (n j + i 1) \cdot \delta_j(T_{i,j})$ be the minimum value obtained by a spanning tree $T_{i,j}$ of P[i, j] rooted at p_j .
- Let $W_i[i, j] = W(T_{i,j}) + (n j + i 1) \cdot \delta_i(T_{i,j})$ be the minimum value obtained by a spanning tree $T_{i,j}$ of P[i, j] rooted at p_i .

- Let $W_j[i, j] = W(T_{i,j}) + (n j + i 1) \cdot \delta_j(T_{i,j})$ be the minimum value obtained by a spanning tree $T_{i,j}$ of P[i, j] rooted at p_j .
- Let $W_i[i, j] = W(T_{i,j}) + (n j + i 1) \cdot \delta_i(T_{i,j})$ be the minimum value obtained by a spanning tree $T_{i,j}$ of P[i, j] rooted at p_i .
- Thus, we can write W* as

 $W^* = W_1[1, n] = W_1[1, i] + W_j[i + 1, j] + W_j[j, n] + i(n - i) \cdot |p_1p_j|$

Karim Abu-Affash (SCE)

25/38

Therefore, $W_1[1, n]$ can be recursively computed using

$$W_{1}[1, n] = \min_{\substack{1 < j \le n \\ 1 \le i < j}} \left\{ W_{1}[1, i] + W_{j}[i+1, j] + W_{j}[j, n] + i(n-i) \cdot |p_{1}p_{j}| \right\}$$

Karim Abu-Affash (SCE)

WADS 2023

Sub-problems: For every $1 \le i < j \le n$, we recursively compute:

 $W_{i}[i,j] = \min_{\substack{i < k \le j \\ i \le l < k}} \left\{ W_{i}[i,l] + W_{k}[l+1,k] + W_{k}[k,j] + (j-l)(n-j+l) \cdot |p_{i}p_{k}| \right\}$

Sub-problems: For every $1 \le i < j \le n$, we recursively compute:

$$W_{i}[i,j] = \min_{\substack{i < k \le j \\ i \le l < k}} \left\{ W_{i}[i,l] + W_{k}[l+1,k] + W_{k}[k,j] + (j-l)(n-j+l) \cdot |p_{i}p_{k}| \right\}$$

$$W_{j}[i,j] = \min_{\substack{i \le k < j \\ k \le l < j}} \left\{ W_{k}[i,k] + W_{k}[k,l] + W_{j}[l+1,j] + (l-i+1)(n-l+i-1) \cdot |p_{k}p_{j}| \right\}$$

Sub-problems: For every $1 \le i < j \le n$, we recursively compute:

$$W_{i}[i,j] = \min_{\substack{i < k \le j \\ i \le l < k}} \left\{ W_{i}[i,l] + W_{k}[l+1,k] + W_{k}[k,j] + (j-l)(n-j+l) \cdot |p_{i}p_{k}| \right\}$$

 $W_{j}[i,j] = \min_{i \le k < j} \left\{ W_{k}[i,k] + W_{k}[k,l] + W_{j}[l+1,j] + (l-i+1)(n-l+i-1) \cdot |p_{k}p_{j}| \right\}$ k < l < i

Karim Abu-Affash (SCE)

WADS 2023

Dynamic peogramming algorithm: We maintain two tables \overleftarrow{M} and \overrightarrow{M} each of size $n \times n$, such that $\overleftarrow{M}[i,j] = W_i[i,j]$ and $\overrightarrow{M}[i,j] = W_j[i,j]$, for each $1 \le i < j \le n$.

Theorem 5

For points in the Euclidean plane, it is NP-hard to compute a Hamiltonian path minimizing the Wiener index.

Proof: We reduce from Hamiltonicity in a grid graph (whose vertices are integer grid points and whose edges join pairs of grid points at distance one).

Theorem 5

For points in the Euclidean plane, it is NP-hard to compute a Hamiltonian path minimizing the Wiener index.

Proof: We reduce from Hamiltonicity in a grid graph (whose vertices are integer grid points and whose edges join pairs of grid points at distance one).

It is well known that the Wiener index of a Hamiltonian path of n points, where each edge is of length one, is ⁿ⁺¹/₃.

Theorem 5

For points in the Euclidean plane, it is NP-hard to compute a Hamiltonian path minimizing the Wiener index.

Proof: We reduce from Hamiltonicity in a grid graph (whose vertices are integer grid points and whose edges join pairs of grid points at distance one).

- It is well known that the Wiener index of a Hamiltonian path of n points, where each edge is of length one, is ⁿ⁺¹/₃.
- Thus, it is easy to see that a grid graph G = (P, E) has a Hamiltonian path if and only if there exists a Hamiltonian path in the complete graph over *P* of Wiener index $\binom{n+1}{3}$.

Given a set P of points in the plane, we showed that

- The spanning tree of P that minimizes the Wiener index is planar.
- One can solve the problem in polynomial time when the points of *P* are in convex position.
- Given a cost W and a budget B, computing a spanning tree of P whose Wiener index is at most W and its weight is at most B is (weakly) NP-hard.
- The Hamiltonian path of P that minimizes the Wiener index is not necessarily planar.
- Computing a Hamiltonian path of P that minimizes the Wiener index is NP-hard.
